PROFILE

I am Job a Mexican web developer, I am seeking an internship opportunity with a reputable company. I have experience in HTML, CSS, and JavaScript, and I am currently learning other technologies such as React, React Native, and Node.js. I am eager to acquire new skills, knowledge, and experience, and I am motivated to grow professionally.

EXPERIENCE (NON-WORK)

In collaboration with four other team members, I contributed to the development of two financial control web applications. In the first project, called Baro (a basic financial control tool), I primarily worked on the frontend and assisted with sessions and backend logic. The project was developed using JSP on a local server. For the second project, we revisited the financial control web application concept and developed it using Node.js and React JS. This second application was hosted on a server, and I focused mainly on the frontend, creating components with React and designing a mobile version using React Native.

In summary, in both projects, I played an important role in frontend development and contributed to the backend in areas such as program logic, sessions, encryption, database structure, and version control using git. I independently learned Node.js and React JS and applied this knowledge to the second project, which we hosted on a server.

EXTRA

I am currently learning TypeScript and React Native to enhance my mobile application development skills and improve the quality of my code. I am also studying UX/UI and layout design to improve user experience and interface design in my web and mobile development projects. Through my UX/UI training, I have acquired skills to research and test with users, and to create wireframes and prototypes using tools like Figma and Adobe XD. All of these skills will enable me to create more effective and appealing designs to enhance the user experience in the applications I develop.
